Government Data Shows Clear Vaccine-Autism Link

Vaccine Epidemic Addresses Devastating Unanswered Questions

On Tuesday, May 10th, 2010 at 12:00pm, investigators and families of vaccine-injured children will unveil a report clearly linking vaccine injury and autism. Mary Holland, co-editor of the recently released book ***Vaccine Epidemic***, is the lead author of the study **Unanswered Questions from the Vaccine Injury Compensation Program**, published today in the peer-reviewed *Pace Environmental Law Review*.

For over 20 years, the federal government has publicly denied a vaccine-autism link, while at the same time its Vaccine Injury Compensation Program (VICP) has been awarding damages for vaccine injury to children with brain damage, seizures, and autism. This investigation, based on public, verifiable government data, breaks new ground in the controversial vaccine-autism debate.

The investigation found that a substantial number of children compensated for vaccine injury also have autism. Based on this preliminary investigation, the evidence suggests that autism is at least three times more prevalent among vaccine-injured children than among children in the general population.

Vaccine Epidemic co-editor Louise Kuo Habakus said, “Parents are fed up with unanswered questions. Congress must investigate what appears to be a cover-up on vaccines and autism. People should read ***Vaccine Epidemic***, because it explains how and why this could have happened and offers proposals for constructive change.”

Vaccine Epidemic, a critique of the U.S. vaccine program that is both thoughtful and passionate, includes chapters explaining the Vaccine Injury Compensation Program, the Vaccine Bubble and the Pharmaceutical Industry, the role of government and the media, an overview on vaccine advice books and more. You can learn more about the newly released report and the book at www.vaccineepidemic.com.
